

WUZZ Change Plate - Option 1: Full System Sync

Engineering-heavy · Full member coverage · Automatic WUZZ ↔ Agent synchronization

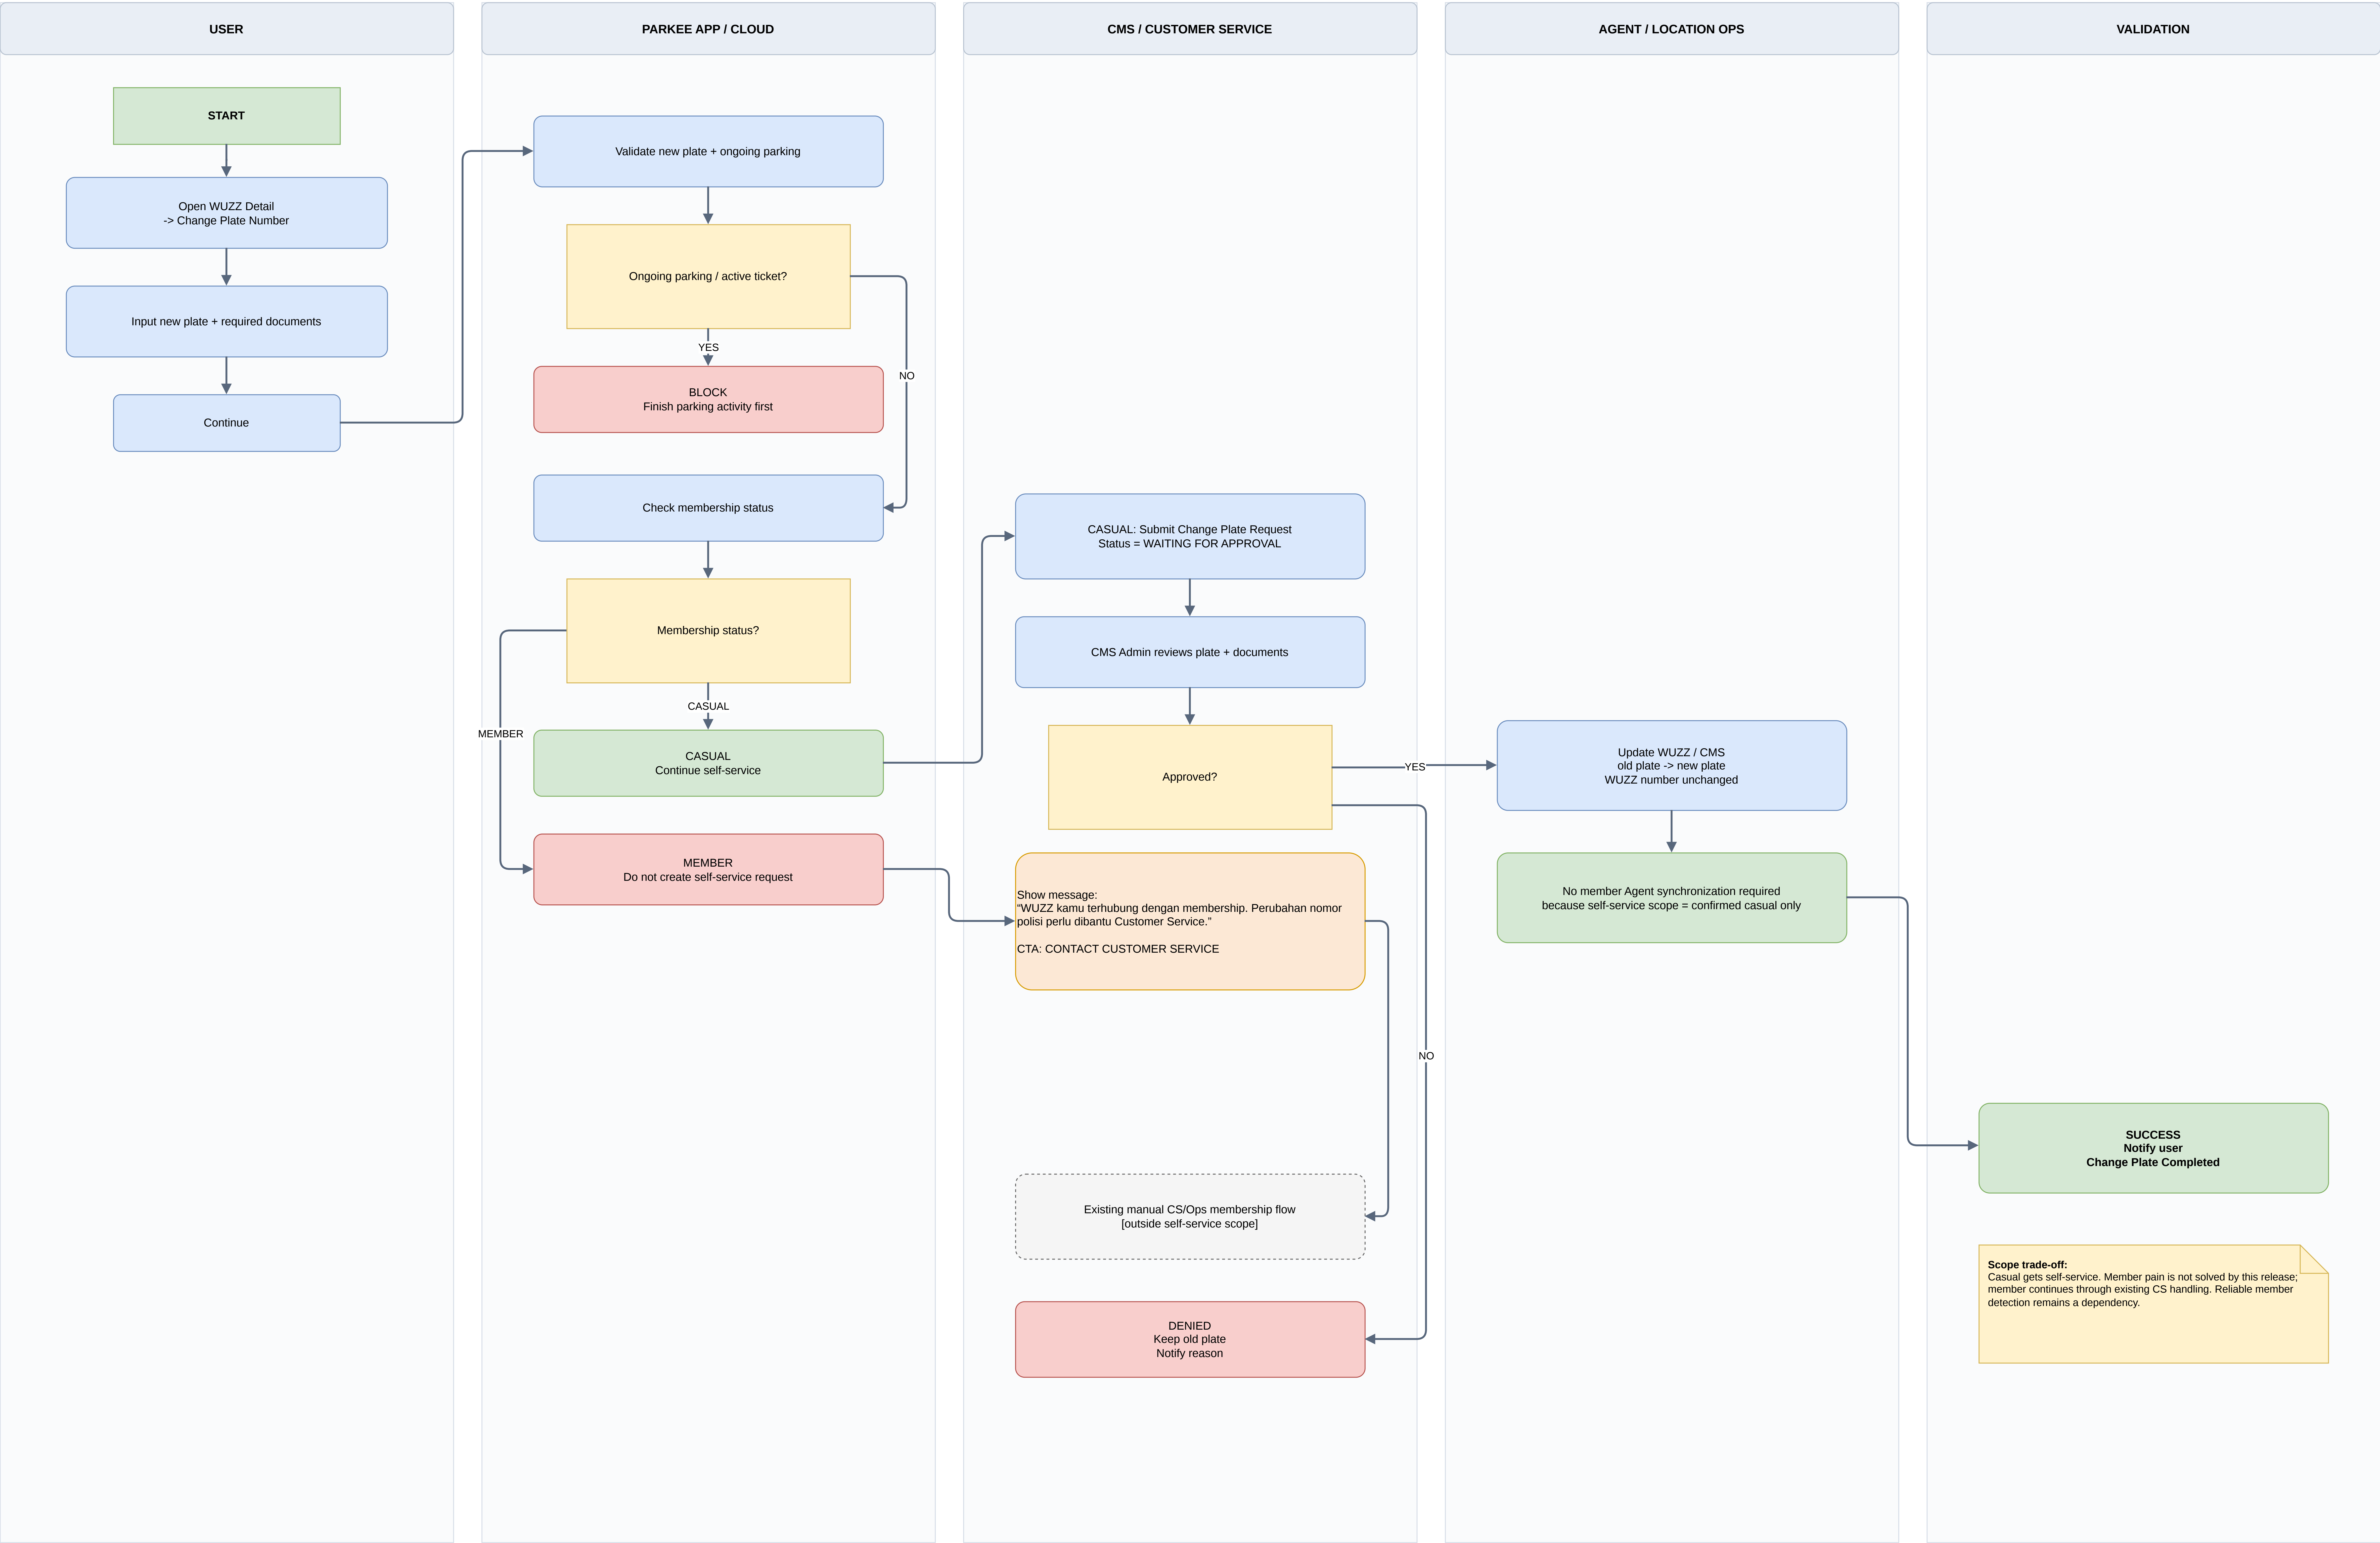

WUZZ Change Plate - Option 2: Assisted Change Plate

CS/Ops-heavy · Full member coverage with manual SOP · App is the intake channel

WUZZ Change Plate - Option 3: Casual-Only Self Service

Minimum scope - Confirmed casual users self-serve - Member / unknown routed to Customer Service

OPTION 1 - FULL SYSTEM SYNC

Engineering-heavy · Full Member Coverage

Who pays complexity? Engineering

Casual: Supported
Member: Supported self-service
Multi-location: System handles
CS effort: Low
Ops effort: Low
Scalability: High

Key dependencies

- Reliable membership lookup
- Agent update API/integration
 - Per-location status callback
- Retry / rollback / partial failure handling
 - Cross-system QA

Main value: Best UX + scalable
Main cost: Highest engineering effort

OPTION 2 - ASSISTED CHANGE PLATE

CS/Ops-heavy · Full Member Coverage with SOP

Who pays complexity? CS + Location Ops

Casual: Supported
Member: Supported request
Multi-location: CS/Ops handles
CS effort: High
Ops effort: High
Scalability: Low

Key dependencies

- User/location verification
- SOP + PIC + escalation
- Manual Agent/Backoffice update
- Tracking all required locations
- Recovery using Request ID

Main value: Lower engineering, member still covered
Main cost: Operational load + residual human error

OPTION 3 - CASUAL-ONLY SELF SERVICE

Minimum Scope · Member Routed to CS

Who pays complexity? Product scope / user coverage

Casual: Supported self-service
Member: Not self-service
Multi-location: Outside self-service scope
CS effort: Existing flow
Ops effort: Existing flow
Scalability: Medium

Key dependencies

- Reliable member detection
- Unknown must route to verification
 - Casual downstream QA
- Existing CS path for members

Main value: Fastest + safest implementation
Main cost: Member pain remains

Decision guide

Need scalable member self-service and willing to invest in Cloud + Agent integration -> **Option 1.**
Need member coverage now with lower engineering effort and willing to absorb CS/Ops workload -> **Option 2.**
Priority = fastest / safest release and member risk is not yet proven safe -> **Option 3.**

Non-negotiable rule across options: SUCCESS ≠ CMS plate updated. Success means the completion criteria for the chosen option are satisfied. For any member flow, if required Agent/location updates are not synced/confirmed, keep the request pending or recover - do not mark success.
